OpenClaw in My Daily Life

From chatbot to personal ops agent

Not just **answering**, but **pulling context, prioritizing, reminding, and acting**.

Meta-point: this deck was created with **OpenClaw** itself — directly through the **OpenClaw TUI** in the live system.

Claus Käpplinger · short intro / ZeitgAIst round

The actual problem

Not too little AI.

Too many open loops across too many channels.

Why I use it at all

The personal version

- I have many parallel topics and channels open at the same time. - My setup is intentionally **local-first** and spread across files, calendar, email, and chat. - So I do not need a “smart chat”; I need something that helps me see **the next meaningful step**.

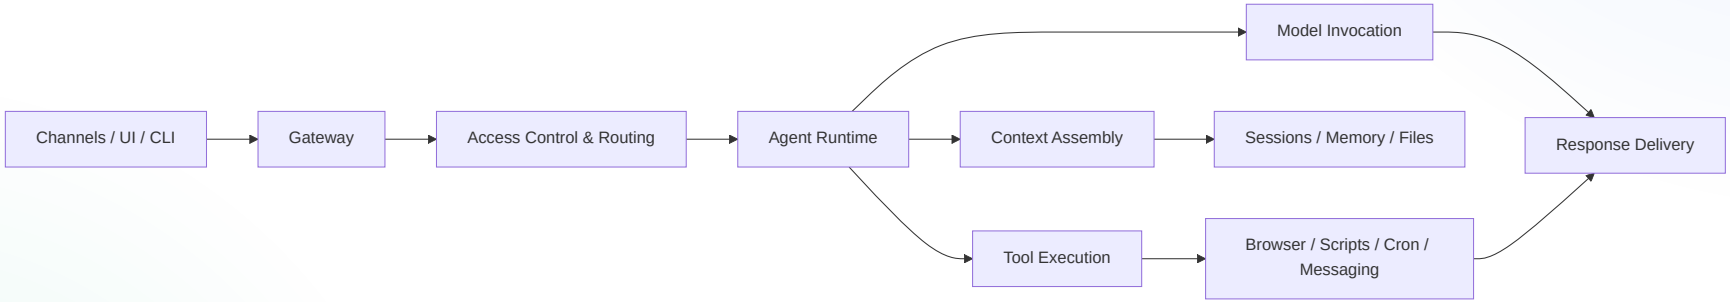
> OpenClaw becomes interesting to me when it does not just sound smart, but actually **removes mental load**.

My thesis

OpenClaw becomes interesting when it sits **between channels and action**.

So not just: “prompt in, text out”
but: **chat + local data + tools + proactive execution**

The architectural idea behind it



What I discovered during the research

And want to try next

- While building this deck, it became clear to me that OpenClaw does not stop at personal assistance. - Two patterns immediately felt relevant because they fit my setup directly.

> That makes OpenClaw feel less like a single bot and more like a **platform for personal infrastructure**.

Example 1

Daily steering through WhatsApp

- I can simply write: **"What matters today?"**
- OpenClaw pulls **local calendar context**
- in my setup that runs through **vdirsyncer + khal**
- the goal is not just listing events, but giving me **one real focus for the day**

> Not: "Here are your appointments."
> But rather: "You have 3 fixed blocks — in between, exactly one meaningful work goal."

What matters today?

2:00 PM university elections with IT
3:00 PM ZeitgAlst: Open Claw
8:30 PM introductory THW meeting

In between: one real work goal, not five.

Source (own practice): local calendar via **vdirsyncer/khal**; focus on real commitments.

Example 2

Proactive assistance on WhatsApp

- daily **check-ins**, **shutdowns**, and **reminders**
- not only on request, but also **at the right time**
- with guardrails: a dedicated bot account is interactive, the main channel is more controlled
- that turns AI into an **assistance layer in daily life**

> This is the actual jump for me:
> **from reactive chat to light proactive support for action.**

Daily check-in. Reply with 4 lines...

Bedtime ramp (15 min). Goal: devices OFF at 9:00 PM.

Quick check: what are you doing right now? Are you on your BIG 1?

Source (own practice): WhatsApp role model + daily cron/heartbeat check-ins.

Example 3

Email triage with a local pipeline

- there is a **local runner** for email triage
- results land in **reports**, not in some black box
- relevant emails are filtered and surfaced back briefly
- the goal is **less overwhelm and fewer context switches**

> Not: “AI reads email.”
> But: **I can see faster what I actually need to react to.**

Concrete in my setup:

```
~/openclaw/scripts/mail_triage_runner.py
~/openclaw/reports/mail-triage/
```

The meta layer: this deck was built with OpenClaw

1. BRIEFING

The nicest demo is almost the meta-demo: OpenClaw is not only being explained here — it was also the tool used to build, export, and publish this presentation through the TUI.

My narrative in one sentence

OpenClaw is not just another smart chatbot for me, but **a personal runtime sitting between my channels and my next meaningful actions**.

Links to take away

Live + repo via QR

> QR is simply the pragmatic exit — nobody wants to type long URLs at the end.

Thanks

If you want, I can show the WhatsApp / TUI / workflow part live afterwards.
